

**Thank you for taking the time to take the test! Some introductory information follows:**

→ We want 2 scenarios to be tackled with an autonomous operator from you, **you may select one scenario from I and II and one more from III and IV**. The first two are more static and well defined, the latter two are more open ended. You will demonstrate your operators to us, when it's ready, during a short call.

We will need an email from you in order to get you access to this dashboard. You will have one week, let us know if you need more time. Contact [dimitrios@seez.co](mailto:dimitrios@seez.co) for any clarifications.

### **Test specifics:**

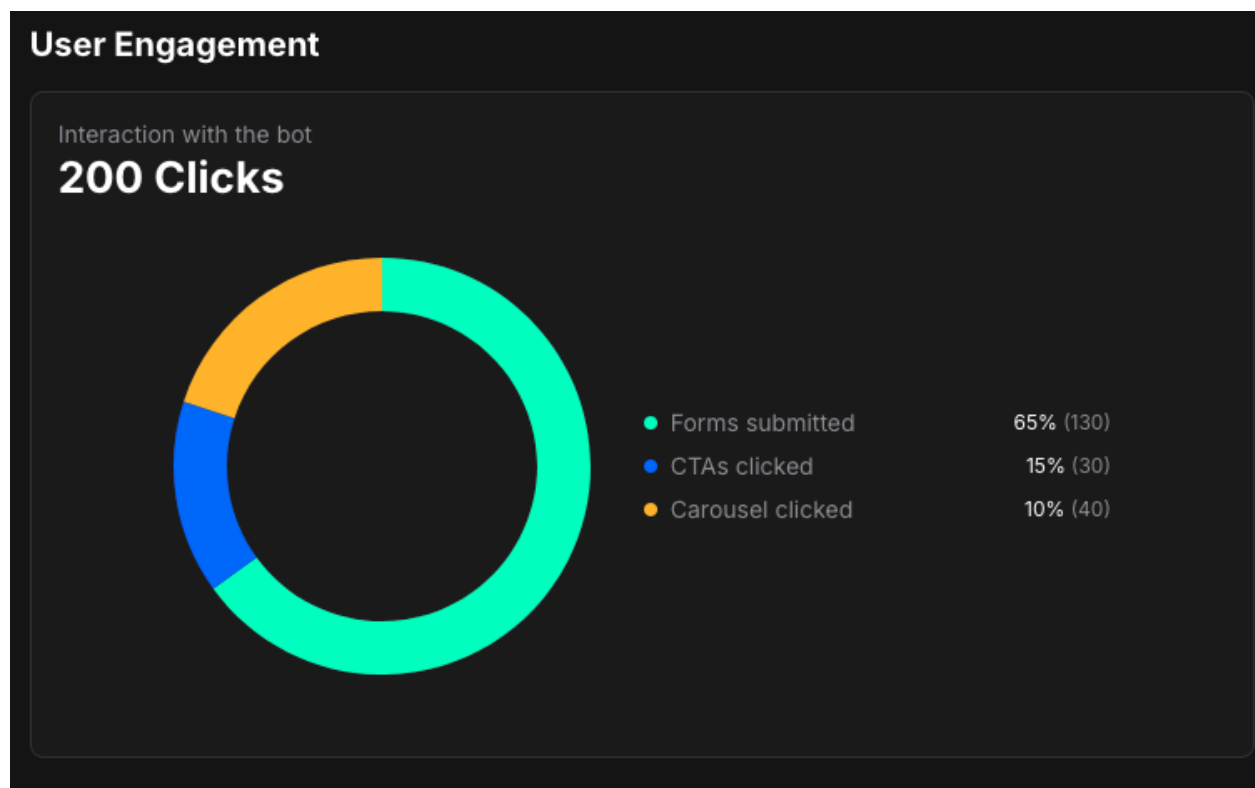

Navigate to Seezar Dashboard (<https://seezar-dashboard.seez.dev/login>), credentials will be provided. Let us know when you start your attempt.

### **Scenario I**

Click on the left hand side on the dealership called "Ejner Hessel"

Click on Analytics tab and select "30 days"

Scroll down and get the top 3 events like in the attachment.

Repeat for dealership called "Approved Automotive"

Compare the numbers and show on a table; for which dealership clicks are more and submitted forms are more?

## Scenario II

From either dealership page, click on the “Chat History” button on the top right. It will download a zip. Uncompress it and read it.

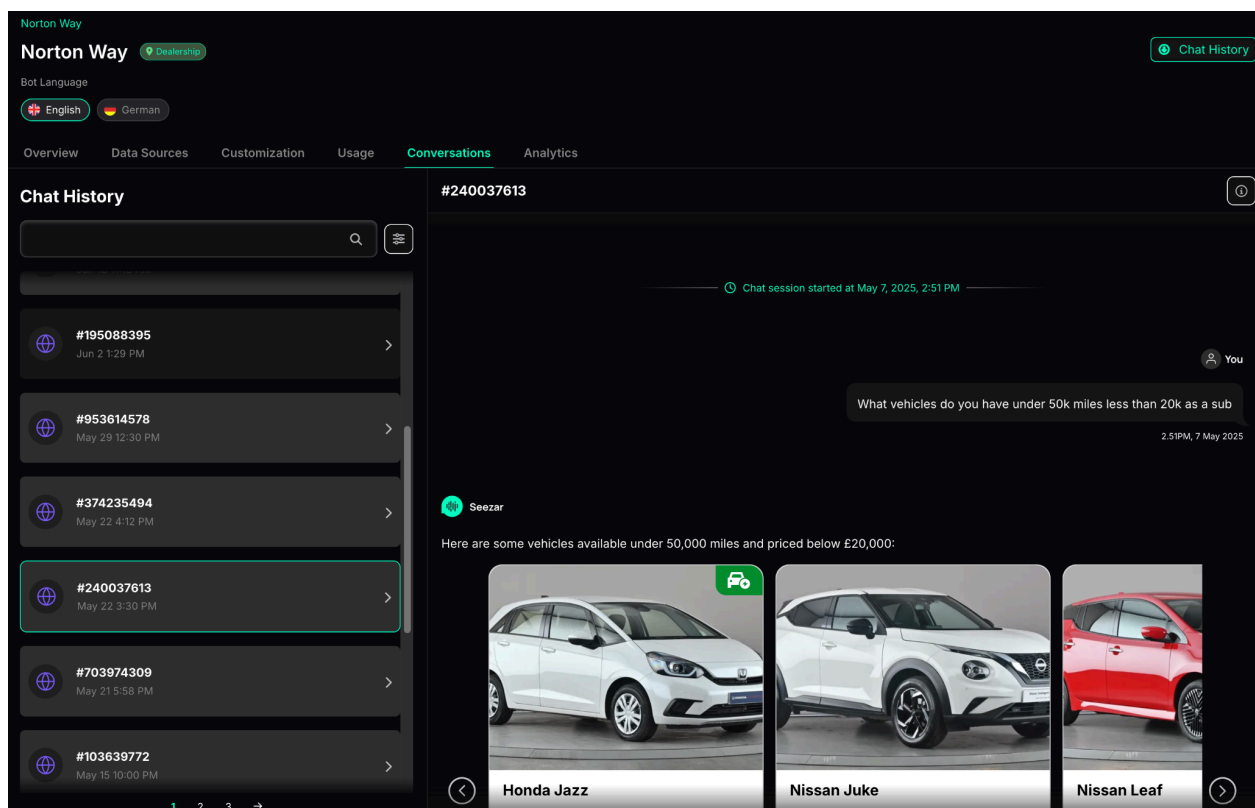

Count how many “Chat Ref” unique values are there. Compare to the number of rows.

Construct this ratio, call it “messages per chat” and show it.

## Scenario III

Deep-Dive Explorer

The agent scrolls down analytics charts and clicks on the most clicked model (e.g., Chevrolet Captiva). It then jumps into the **Conversations** tab to see how many users mentioned this model.

It builds a mini-report:

Which car models get the most interest

What topics people discuss around them (pricing, inventory, financing, etc.)

## Scenario IV:

Anomaly Detector

The agent goes to each dealership one by one. (If it's too much in terms of resources, check the first 10 dealerships). It scans Analytics over 7 days vs 30 days. It highlights dealerships where the conversion rate dropped or chat volume spiked unusually.

It prepares a short “alert report” showing which dealership might need attention.
